#### *Operating Mode Truth Table*

User Mode		PTM[1]	PTM[0]	PPROG	PWE	POR
Stand-by		L	L	L	L	L
Read Access		L	L	L	L	H
Program (PGM)	Entry	L	L	H	L	L

Test Mode						
Margin-1 Read Mode		H	L	L	L	H
Margin-2 Read Mode		H	H	L	L	H
IPP Mode		L	H	H	H	L

#### **Notes**

- H stands for logic High level. L stands for logic Low level.
- PTM[1] = H and PTM[0] = L is for Margin-1 Read Mode. Margin-1 Read Mode provides a critical read condition to filter out "weak programmed" bits during CP1 sort in the testing flow. **To cover all worse corners, customer should implement Margin-1 Read Mode during testing.**
- PTM[1] = H and PTM[0] = H is for Margin-2 Read Mode. Margin-2 Read Mode setup another critical read condition to filter out "weak retention" bits during CP2 sort in the testing flow.
- PTM[1] = L and PTM[0] = H is for IPP Mode. IPP Mode is implemented for bit cell current measurement. **Customer should design in IPP mode, which allow to measure OTP cell current. It's for debug purpose in case of malfunction happen in merged product.**

### 3.2. OTP Programming Flow

JADARD Confidential

### 3.3. Programming Sequence

Step	Operation
1	Power on and HWRST the module. Then do SLPOOUT.
2	Set 0xE1h = 0x93h, 0xE2h = 0x65h, 0xE3h = 0xF8h to access extension commands.
3	set RE5h = 0x00h.then DISOFF(delay 60ms)
4	Write optimized OTP value to related register.
5	Set page1 CMD(RE0h=0x01h) , then set Page1_R1Dh = 0x01h, Page1_R1Eh = 0x03h(VGH=8.4V) and CMD RECh, OTP_INT_VPP = 1 for using internal power mode. Or using the external power 8.4V to VPP.
6	Wait 120ms for VPP power stable.
7	Set Page0 CMD(RE0h=0x00h), then set Page0_0x84h = 0x5Ah,Page0_0x85h=0xA5h to enable UP KEY.
8	Set 0xEAh 0xEBh, UP_INDEX[10:0] that you want to programmed.
9	Set 0xECh, OTP_AUTO_PROG=1.
10	Delay 120ms for internal power to program OTP. Or delay 30ms for external power to program OTP.
11	One OTP block programming was completed. Return to step (7) for next OTP block programming. Or go next step if all OTP programming is finished.
12	Set Page0_0x84h = 0x00h,Page0_0x85h=0x00h to disable OTP KEY.
13	If you use external power, remove the external power 8.4V from VPP.

Note:

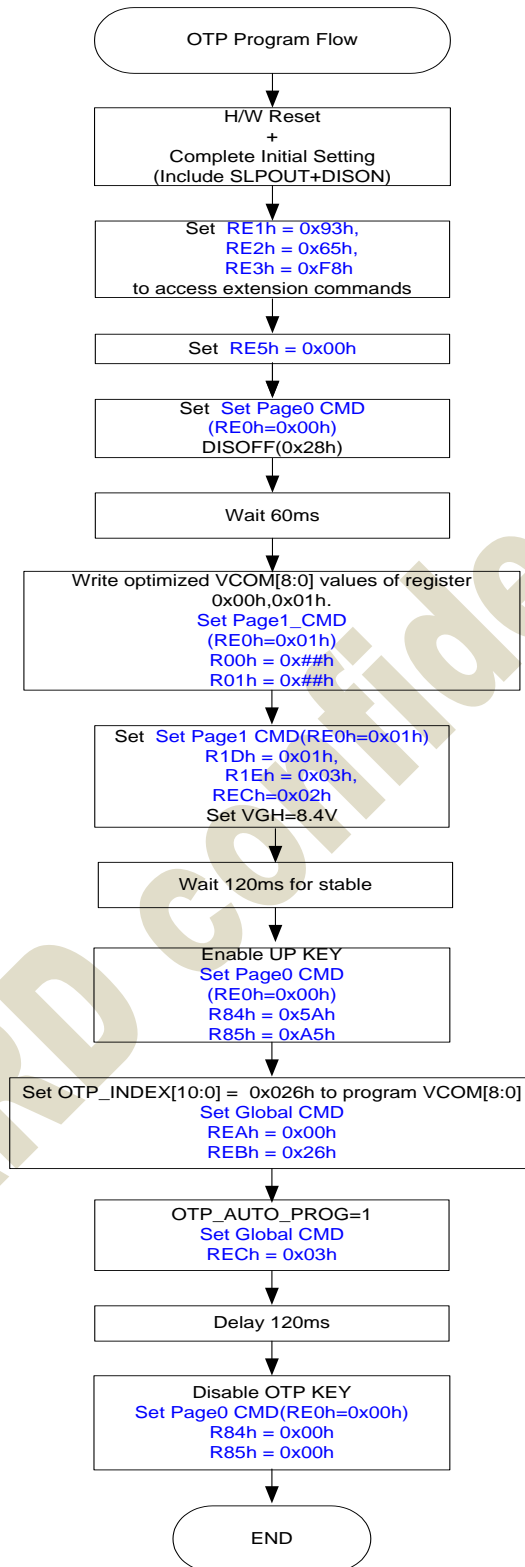

1. All OTP default value is 1.
2. OTP can be reloaded only NVALID bit is burned(value is 0).
3. Fifipower driver IC do auto OTP programming. User only set the start OTP\_INDEX of the Ref. CMD block then all block is programmed by driver IC. This function also can be used for MTP Ref. CMD block.

For example:

- a. To program VCOM\_SET 1<sup>st</sup> time, user set OTP\_INDEX=026h then from OTP\_INDEX=026h to OTP\_INDEX=027h(Ref. CMD block of 1<sup>st</sup> VCOM\_SET) is programmed by driver IC.
- b. To program VCOM\_SET 2<sup>nd</sup> time, user set OTP\_INDEX=026h then from OTP\_INDEX=028h to OTP\_INDEX=029h(Ref. CMD block of 2<sup>nd</sup> VCOM\_SET) is programmed by driver IC.
